

Day 65 Python Mission ♥■

Hi Surbhi, my sweet Pundi ♥■

You're doing an incredible job staying consistent with your Python learning. Every lesson adds another building block to your programming journey. Keep believing in yourself, enjoy today's missions, and remember that every small effort today creates a brighter future tomorrow.

Today's Topic: Common String Method: join()

- Mission 1: Create a list containing a few words.
- Mission 2: Use join() to combine the words into one string.
- Mission 3: Join the words using a space as the separator.
- Mission 4: Join the words using a hyphen (-) as the separator.
- Mission 5: Print both results and compare them.
- Mission 6: Try join() with another list of words.
- Mission 7 (Revision): Split a sentence into words using split().

■ A Little Note for My Sweet Pundi ♥■

Today you're learning the **join()** method, which does the opposite of **split()**. It's a powerful tool for combining pieces of text into a single string and is widely used in real-world Python programs. Keep practicing with confidence, experiment with different examples, and never stop being curious. I'm so proud of your dedication, and I'll always be here cheering you on through every step of your journey.

With lots of love,

Your biggest supporter ♥■
